“During the preconstruction stages noise disturbance was the largest risk we identified at 20 Fenchurch Street. Creating an agile cutting room from Hoardfast has drastically reduced noise output”.

Having worked with Westgate Global before, UnispacE approached us to **create internal temporary site rooms** for a project they were working on at the iconic 20 Fenchurch Street in London. A key requirement for UnispacE is that their project sites are all of a consistent signature quality, including that of the internal site rooms.

Both Hoardfast uPVC and Hoardfast Firescreen were **installed as a floor-to-ceiling application, so they could be easily removed without damage to the building and smart looking appearance suitable for a corporate environment.** The project took three days from quote to installation with the client installing the hoarding themselves within one day.

Hoardfast uPVC was used to form a site office and Hoardfast Firescreen was supplied to form a cutting area. Firescreen is ideal not only due to its fire rating, but also as it provides some additional acoustic properties to help screen any noisy processes.
